Prompt:

I want to implement a new feature in this web application that adds a "Testing Type" classification to the generated API test cases.

Please review the codebase and implement this across the frontend and backend.

Feature Requirements

1. **Testing Type Classification Options:**

- The supported testing types must be: "Smoke", "Sanity", "Regression", and "Functional".

2. **UI Summary Cards / Count Badges (See image_rvA6_K.png):**

- Add a row of visual metric blocks/cards right above the test cases table (or update the existing ones) to show the aggregate counts grouped by Testing Type.

- Example : Smoke (1), Sanity (2), Regression (4), Functional (0).

3. **Table Column Update:**

- Add a new column named "TESTING TYPE" to the test cases data table.

- Position it between the "CATEGORY" and "TITLE" columns.

- Each row must render a pill/badge component containing the assigned testing type value with appropriate background coloring (e.g., Green for Smoke, Orange for Sanity, Red for Regression).

4. **Dropdown Filter:**

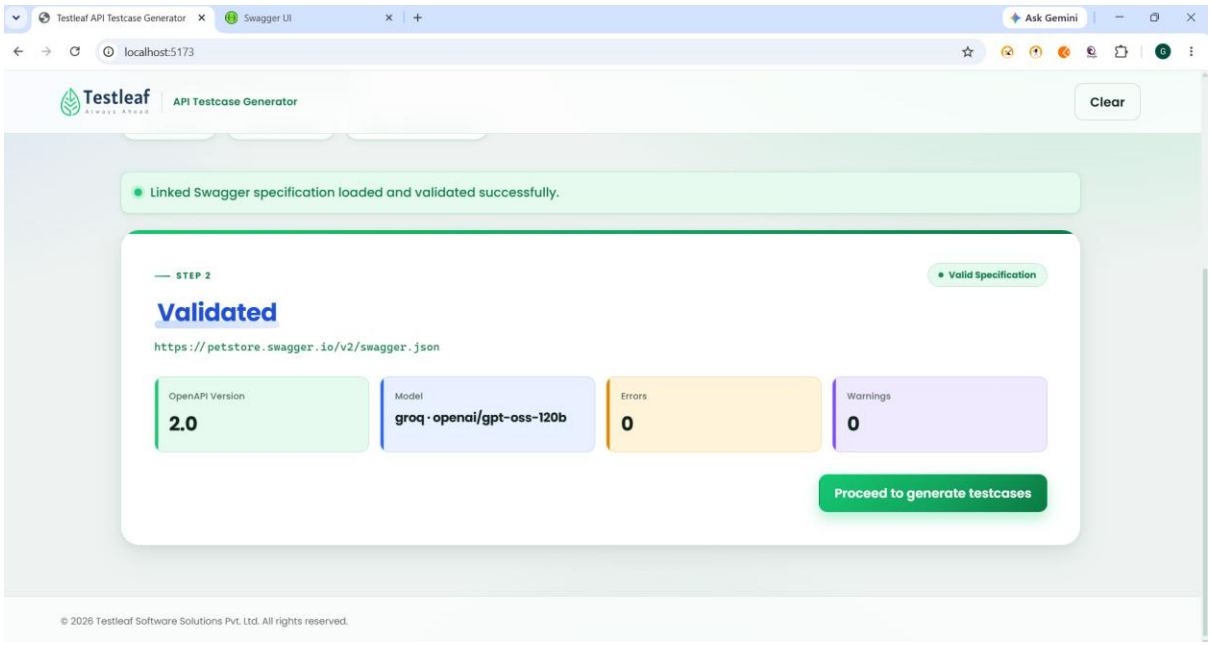

- Ensure the "All testing types" dropdown filter in the table controls effectively filters the table rows based on the selected classification.

5. **Data Model / State Update:**

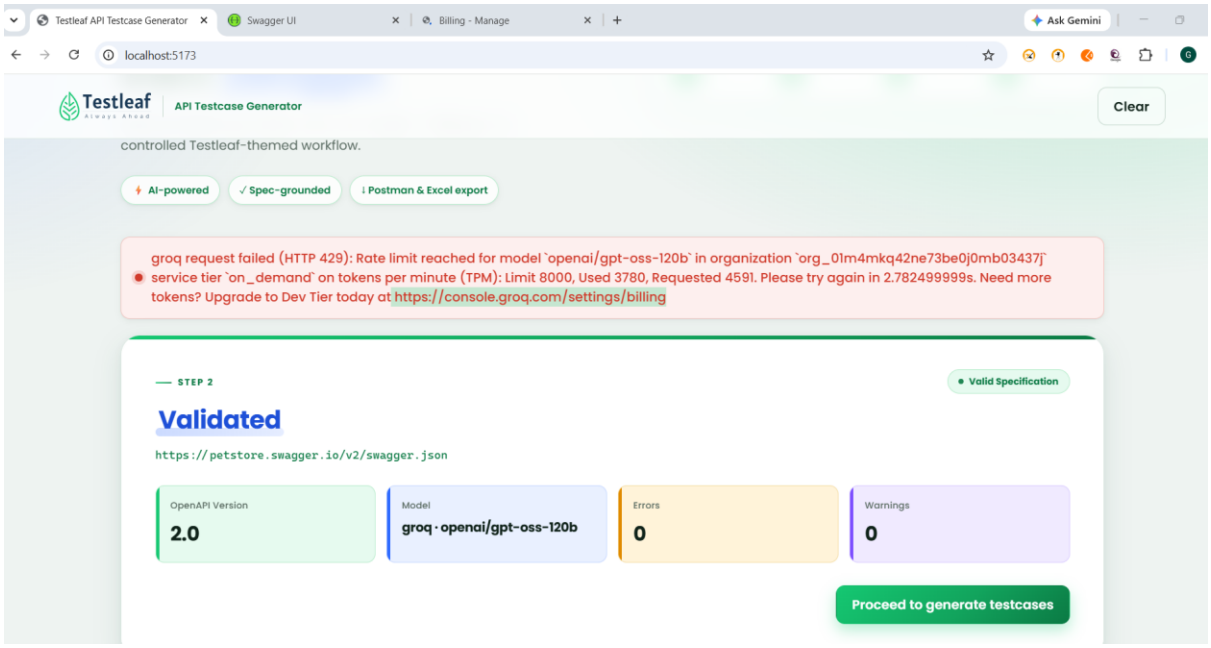

- Update the Test Case interface/type definition to include a `testingType` field.

- Update the mock data or test case generator logic to populate this field so that it reflects the counts shown in the images (1 Smoke, 2 Sanity, 4 Regression, 0 Functional).

Please analyze the components responsible for rendering the dashboard layout, the metrics section, and the test cases data table, then implement these changes cleanly using existing UI paradigms and styling rules.

Got Rate limit error on click of “Proceed to generate test cases”

Got same rate limit error for couple of retries. It worked and generated API Test cases in fourth attempt with Testing type.
